FOREWORD

Since 2012, the National Institute of Statistics of Rwanda (NISR), in collaboration with the Ministry of Agriculture and Animal Resources (MINAGRI), the National Agricultural Export Development Board (NAEB), and the Rwanda Agriculture and Animal Resources Development Board (RAB), conducts the annual Seasonal Agricultural Survey following the three Rwanda agricultural seasons. The survey aims at estimating the national crop production, cultivated and harvested area, crop yield, agricultural inputs, and practices crucial for monitoring progress on agriculture programs and policies in Rwanda.

This published report reflects the importance of the Seasonal Agricultural Survey (SAS) information for use as a tool to assist in addressing key agricultural issues and information needs that will inform policymakers and other stakeholders and allow more effective identification of priority intervention needs.

Therefore, I recommend stakeholders, government, researchers, partners and the general public to optimally make use of the findings of this report.

I am grateful to NISR staff and other stakeholders who worked tirelessly to ensure the 2022 Seasonal agricultural survey was successfully implemented.

MURANGWA Yusuf
Director General, NISR

EXECUTIVE SUMMARY

This report highlights the findings of the Seasonal Agricultural Survey (SAS) for the agricultural year 2021/2022. It covers three agricultural seasons; Season A which starts from September to February of the following year and Season B which starts from March to June. Season C is the shortest agricultural season with vegetables and sweet potato predominantly grown in swamps and Irish potato mostly grown in the volcanic agro-ecological zone. This report, therefore, consolidates the findings of all seasons and hence, highlights the findings mainly related to:

1. Land use:
 - Agricultural land: this indicates land potential for agriculture, including land currently being used for farming as well as land that can be brought back into cultivation (fallow or pastureland).
 - Arable land: land able to be grown and produce crops for food and feeds supply purpose. This area excludes land under permanent crops¹ and permanent pasture.
 - Physical crop cultivated area: area occupied by crops. In other words, it can be called cropland;
 - Pastureland: area under natural grasses reserved for livestock or occupied with fodder crops;
 - Fallow land: cultivable land free for cultivation in a temporal period (less than 5 years);
2. Crop land: Cultivated land devoted to each grown crop.
3. Crop production: Amount of harvested crop used for food or livestock (quantified into kilograms or tons.)
4. Crop yield: It is a measurement of the amount of crop harvested per unit of land area (kg per hectare). It is used to determine the efficiency of crop production.
5. Use of inputs (this assesses the level of using improved seeds, fertilizers and pesticides)
6. Agricultural practices (practice of irrigation and soil erosion control) and others.

Estimates provided in this report are summarized as totals, percentages and averages at district and national levels. They are based on data obtained by a sample of surveyed small-scale plots and large-scale farmers. The data related to tea and coffee are obtained from administrative records collected by National Agricultural Export Development Board (NAEB) through the routine activities of monitoring coffee and tea production, and coffee census conducted every five years.

Land use

Results of SAS 2022 shows that, out of 2.377 million hectares of total country land, agricultural land (land potential for agriculture) covered 1.402 million hectares (59% of total country land) in Season A compared to 1.393 million hectares (58.6% of total country land) in season B. Out of the total agricultural land, 1.067 million hectares was used for Seasonal crops in season A compared to 1.014 million hectares in season B.

¹ Permanent crops are crops produced from plants which last for many seasons, rather than being replanted after each harvest. Those crops are fruit trees, sugar cane, coffee, tea, banana, tree plantations, nuts trees...).

Around 0.6 million hectares are area under permanent crops in both seasons A and B, while 0.135 million hectares was used under permanent pasture in season A compared to 0.133 million hectares in season B.

Use of inputs

In 2022 agricultural year, 33.1 percent of farmers used improved seed in season A compared to 8.7 percent in season B and 26.1 percent in season C. In regards to use of fertilizers, 69.7 percent of farmers applied organic fertilisers in season A compared to 57.9 percent in season B and 82.3 percent in season C, while 38.6 percent applied inorganic fertilizers in season A against 27.5 percent in season B and 71.5 percent in season C. Moreover, 19.8 percent of farmers used pesticides in season A compared to 15.9 percent in season B and 70.1 percent in season C.

Agricultural practices

In regard to agricultural practices, over 90 percent of interviewed farmers protected the cultivated land against soil erosion throughout the year. 8.2 percent of farmers practiced irrigation in seasons A compared to 8 percent in season B and 62.9 percent in season C. The main indicators covered during the SAS 2022 are summarized in table 0:

I. INTRODUCTION

Agriculture continues to be one of the most important pillars of economic growth for Rwanda, and a much emphasis for agriculture transformation has been underpinned under the new national development strategy. In recognition of its potential in economic development, food security and poverty reduction, the government has set an ambitious agricultural agenda under the new strategy for transformation of agriculture (PSTA 4) aiming at transformation of Rwandan agriculture from a sector characterised by low productivity to a sector using knowledge to increase productivity and investing in value addition and commercialization.

Quality agriculture statistics are useful in monitoring the performance of national agricultural programs and hence, imperative for evidence-based decision making. While the use of statistics in decision-making processes continues to grow, the demand for agriculture data is also increasing. In this regard, the National Institute of Statistics of Rwanda (NISR) in collaboration with the Ministry of Agriculture and Animal Resources (MINAGRI) conducts the Seasonal Agricultural Survey (SAS) to gather agriculture information mainly related to potential agricultural land use; crop area, crop yield and production; agricultural inputs and practices as well as other agricultural statistics.

The data related to tea and coffee are obtained from administrative records collected by National Agricultural Export Development Board (NAEB) through the routine activities of monitoring coffee and tea production. Other agriculture data is obtained from MINAGRI and Rwanda Agriculture and Animal Resources development Board (RAB), district agronomists, and other partners working in the agriculture sector, including total quantity of agricultural inputs used, total agricultural exports, crop varieties grown, crop intensification program among others. Seasonal Agricultural Survey (SAS) covers three main agricultural seasons: Season A (September to February of the following year), Season B (March to June) while Season C (July-September) is a shorter season mainly for vegetables, sweet potato grown in swamps and Irish potato grown in the volcanic agro-ecological zone.

1.1.Objective of the Survey

The main objective of SAS is to provide timely, accurate, reliable and comprehensive agricultural statistics that describe the structure of agriculture in Rwanda mainly in terms of land use, crop area, yield and crop production. The survey results are useful to monitor the performance of current agricultural season and facilitate evidence-based decision making for the development of the agricultural sector. This report presents the findings of 2021/2022 agricultural year related to:

1. Land use:

- Agricultural land: includes land already used for farming and land that can be brought back into cultivation (fallow or pasture land). Agricultural land indicates land potential for agriculture.
 - Arable land: land able to be grown and produce crops for food and feeds supply purpose. This area excludes land under permanent crops and permanent pasture.
 - Physical crop cultivated area: area occupied with crops.
 - Pasture land: area under natural grasses reserved for livestock or occupied with fodder crops;
 - Fallow land: cultivable land free for cultivation in a temporal period (less than 5 years);
-

2. Crop land: Cultivated land devoted to each cultivated crop.
3. Crop production: Quantity of harvested crop produce used for food, livestock feeds, seeds, etc (quantified into kilograms or tons.)
4. Crop yield: It is a measurement of the quantity of crop harvested per unit of land area (kg per hectare). It is used to determine the efficiency of food production at a certain period.
5. Use of inputs (this assesses the level of use of improved seeds, fertilizers and pesticides)
6. Agricultural practices (practice of irrigation and soil protected against erosion) and others.

II. SURVEY DESIGN

2.1. Sample frame design

To provide the basis for conducting probability surveys based on complete coverage of the farm level, and as a better way of collecting agricultural data and find better precise survey estimates, SAS uses a Multiple-Frame Sampling (MFS) methodology by which, area frame is constructed, and survey sample is drawn from it. In addition, a list frame of large-scale farmers (LSF), with at least 10 hectares of agricultural holdings is done to complement the area frame to cover crops mostly grown by large scale farmers which are not easily covered in area frame. To construct area frame, the process involves the following two steps: land cover classification, land stratification and sampling of segment.

2.2. Land classification

Land classification was done using Rwanda land cover map which is a combination of different layers available in the country, plus a photo interpretation of a series (2010 to 2020) of high-resolution satellite images from Worldview. The Rwanda land cover map is divided into 13 land cover classes (as shown in Table 1).

Table 1: List of Rwanda land cover classes

Code	Land cover class name	Area (Ha)	Percentage share
1.0	Consolidated tea plantations	17,821	0.70
1.1	Hillside agricultural land	1,343,933	53.10
2.1	Non-rice agricultural wetland	55,807	2.20
2.2	Paddy rice wetland	21,848	0.90
2.3	Non cropped wetlands	37,743	1.50
3.0	Rangeland	144,490	5.70
4.1	Urban settlements	31,612	1.20
4.2	Rural settlements	78,928	3.10
5.0	Bare land/rocks	15,404	0.60
6.0	Water bodies	135,295	5.30
7.0	National parks	241,455	9.50
8.0	Protected wetland	12,201	0.50
9.0	Forest plantations	395,001	15.60

Source: NISR, SAS 2022

Map 1: Rwanda land classification map

Source: NISR, SAS 2022

The second step of building the area sample frame was to group land cover classes into strata in order to identify agricultural strata to be considered in sample frame.

2.2.1. Stratification

Out of thirteen land cover classes, five are considered for the agricultural survey frame. These classes are:

- Tea plantation,
- Hillside agricultural land,
- Non-rice agricultural land,
- Paddy rice agricultural wetland,
- Rural settlement.

The remaining land cover classes are excluded from the sampling frame due to low potentiality for agriculture activities. The sampling frame is made of a set of square clusters (segments) of 9 hectares each covering the whole country. By overlapping the clusters layer with land cover classes layer, each cluster is assigned a dominant land cover class as a stratum definition. This is based on a defined thresholds as follow:

Table 2: List of strata

Stratum	Stratum name	Definition
1	Dominant hill crop land stratum	Clusters with Hillside agricultural land cover class greater or equal to 60 percent of the total area of the cluster
2	Dominant Wetland crops stratum	Clusters with non-rice wetland land cover class greater than 25 percent of total area of the cluster
3	Dominant rangeland	Clusters with rangeland land cover class greater or equal to 60 percent of the total area of the cluster
4	Mixed stratum	The rest of other possible combinations
9	Excluded stratum	All clusters with excluded land cover classes greater or equal to 50 percent of the total area of the cluster

Source: NISR, SAS 2022

In addition, tea plantation class data which are recorded by the National Agricultural Export Development Board and large-scale farms which are completely enumerated during the Seasonal Agricultural Survey, were not considered in the agricultural strata taken in sample frame. This means that only dominant hill crop land stratum, dominant wetland crops stratum, dominant rangeland stratum and mixed stratum were considered as area frame from which a sample segment was selected.

Table 3 Number of segments (Population size) per district by stratum

Source: NISR, SAS 2022

2.3. Sampling procedures

Out of five defined agricultural strata, only dominant hill crop land stratum, dominant wetland crops stratum, dominant rangeland stratum and mixed stratum are considered as land potential for agriculture. The remaining stratum is the non-agricultural land. Note that clusters covered by tea plantations are not considered in the area sample frame due to reasons stated above. Thus, SAS is conducted on 4 above mentioned strata to cover other major crops where a total of 1,200 segments constitutes the SAS sample.

At first stage, 1200 segments are selected and allocated at district level based on the power allocation approach (Bankier, 1988²). Sampled segments inside each district are distributed among strata with a proportional-to-area criterion.

Table 4: Allocation of sampled segments per district by stratum

District	Stratum				Total A & B	Season C
	Dominant hill crop land	Dominant wetland crops	Dominant rangeland	Mixed stratum		
Nyarugenge	12	6	-	2	20	10

² Bankier M.D. (1988) Power allocations: determining sample sizes for subnational areas. The American Statistician, Vol. 42, n. 3 pp. 174-177.

At second stage, 25 sample points were systematically selected, following a special distance of 60 meters between points. Sample points are reporting units within each segment, where enumerators go to every point, locate and delineate plots in which the sample points fall, and collect records of land use and related information.

The recorded information represents the characteristics of the whole segment which are extrapolated to the stratum level and hence the combination of strata within each district provides district area related statistics.

Map 2: Map showing square cluster(segment) with 25 sampled points

Source: NISR, SAS 2022

2.3.1. Weighting Procedures

Based on the stratified two-stage sample design used with the new area frame, the first stage sampling probability for the sample segments in each stratum is calculated as:

$$p_{1h} = \frac{n_h}{N_h}$$

where:

p_{1h} = probability of selection of sample segments in stratum h (district by stratum)

n_h = number of sample segments selected in stratum h

N_h = Total number of segments in the area frame for stratum h in each stratum

The second stage probability was calculated at the plot level based on the assumption that the plots within each sample segment were implicitly selected with PPS using the area of the plot as the measure of size. Therefore, the second stage probability of selection can be expressed as follows:

$$p_{2hi} = \frac{g_{hi} \times A_{hij}}{A_{hi} \times g_{hij}}$$

Where:

p_{2h} = Probability of selection of the plot in segment h

g_{hi} = Number of grid squares selected in the i-th sample segment of stratum h

A_{hij} = Area of the j-th sample plot selected in the i-th sample segment of stratum h

A_{hi} = Area of the i-th sample segment of stratum h

g_{hij} = Number of selected grid squares in the j-th sample plot of the i-th sample segment of stratum h

The weight of a sample plot is equal to the inverse of the first and second stage probabilities of selection:

$$W_{Phij} = \frac{1}{p_{1h} \times p_{2hi}} = \frac{N_h \times A_{hi} \times g_{hij}}{n_h \times g_{hi} \times A_{hij}}$$

Where:

W_{Phij} = weight for the j-th sample plot in the i-th sample segment in stratum h

2.4. Data Collection design

During the SAS 2022, data collection covered three main agricultural seasons A, B and C and was conducted into two separate phases in each season: the first phase, known as screening activity (post-planting phase), consists of visiting all sampled segments and demarcating all plots with sampled points with the aim of covering the information related to land area, planted crops and land use. While the second phase involves capturing of production data by visiting sampled agricultural plots identified from screening activity as well as all Large-Scale Farmers (LSF). To ensure the smooth completion of the SAS workload, NISR employed 131 Enumerators and 29 Team Leaders. All fieldwork staff hold a degree in agriculture sciences and were consistently trained by NISR headquarter staff before starting data collection in each season. Moreover, a higher-level supervision was organised and done by staff from NISR who frequently visited the field teams during each phase of data collection in order to ensure the quality of collected data.

2.4.1. Time frame

The Seasonal Agriculture Survey (SAS) data collection was conducted following the three ordinary agricultural seasons. The SAS field activities were carried out during the regular seasons' calendar that covers the approximate monthly periods as follows:

- Season A starts in September 2021 and ended with February 2022
- Season B starts in March 2022 and ended with June 2022,
- Season C, which begins in July and ends in September 2022, is a short agricultural season in which vegetables and sweet potatoes are grown primarily in marshlands, whereas Irish potatoes are grown in volcanic agro-ecological zones.

Figure 1: Agricultural seasons calendar

Source: NISR, SAS 2022

Specifically, During the 2022 SAS, the field work for season A started from 5th December 2021 and ended on 24th February 2022 while season B data collection was conducted from 24th April and ended on 30th June 2022. In both seasons, data collection was carried out in 1,200 segments and 336 large scale farmers' holdings across the country. Besides, the data collection of season C was carried out in 2093 sites potential to grow season C crops in addition to 513 segments and started from 6th September and ended on 30th September 2022.

2.5. Data collection tools and materials

Seasonal Agricultural Survey used two questionnaires:

- **Screening Questionnaire:** Screening questionnaire is a questionnaire used to collect information mainly related to land use, plot area and crop cultivated of the delineated plot.
- **Plot Questionnaire:** Plot questionnaire is a questionnaire used to collect information on the sampled plots mainly related to crop production, inputs used and agricultural practices.

The computer assisted personal interview (CAPI) data collection methodology was used based on three different software applications:

- **Collector:** which is GIS based application, is used to identify and navigate the enumerator team to the exact GPS sample-point location and for mapping the plot boundary for GIS area determination,
- **Survey 123:** which is GIS based application, used to collect screening data for Large-scale farmers.
- **CS Entry application:** which is a CSPro data entry application used on Android tablets, was used to collect data for interview of plot questionnaire.

Before proceeding to the field, enumerators and their team leaders ensure that they have required materials for their fieldwork. Each enumerator and team leader had adequate materials composed of enumerator's instruction manual, android tablet, charger, Power banks, pens, notebooks, pencils, calculator, weighing scales, Global Positioning System (GPS), boots, as well as transport facilitation.

2.5.1. Field data collection procedures

The SAS data collection is carried out into two phases:

- **Screening Activity of the Segment:** Arriving at the segment, field workers use GPS to direct them to the sampled point inside the segment. Arriving at the point, enumerators identify plot boundary with the guide of the farmer and delineate the plot using the collector application with GPS connected to the tablet. For large scale farmers, the team ensures a complete enumeration of plots with at least 10 hectares.
- **Farm Interview:** After screening activity, only sampled agricultural plots are provided to enumerators for collecting information using the plot questionnaire.

2.6. Data processing and analysis

CAPI data collection method used allows the enumerators to collect data with the tablets and synchronize to the central server at headquarter where data are received, checked for consistency and transmitted to analysts for further analysis using STATA and Excel.

2.7. Concepts, definitions and estimation methods

1. Total land area: Total land area at district level is the district area excluding area under inland water bodies. The definition of inland water bodies generally includes major rivers and lakes.

2. Agricultural area: Agricultural area includes arable land, land under permanent crops and permanent pasture.

3. Arable land: As defined by FAO, arable land includes land under temporary crops (double-cropped areas are counted only once), temporary meadows for mowing or pasture, land under market and kitchen gardens and land temporarily fallow (less than five years). The abandoned land resulting from shifting cultivation is not included in this category. Data for arable land are not meant to indicate the amount of land that is potentially cultivable.

4. Permanent crop land: Permanent crops are sown or planted once and occupy the land for some years and do not need to be replanted after each annual harvest, such as cocoa, coffee and rubber. This category includes flowering shrubs, fruit trees, nut trees and vines, but excludes trees grown for wood or timber. The following crops are considered as permanent crops in SAS: Cooking banana, Dessert banana, Banana for beer, Avocado, Coffee, Sugar cane, Macadamia, Olive, Mango, Apple, Papaya, Orange, Lemon, Guava, Mulberry, Stevia, Jatropha, Palm, and Tea.

5. Permanent pastureland: Land used permanently (five years or more) for herbaceous forage crops, either cultivated or growing wild (wild prairie or grazing land).

6. Irrigated agricultural land: Area equipped for irrigation, which is actually irrigated, (sometimes expressed as a percentage of the total land area). Part of the area equipped for irrigation refers to area equipped to provide water to crops and includes areas equipped for full/partial control irrigation, equipped lowland areas, and areas equipped for spate irrigation. Part of the area equipped for irrigation which is actually irrigated refers to physical areas. Irrigated land that is cultivated more than once a year is counted only once.

7. Physical area: Physical area refers to the total area of the plot as physically measured. The physical agricultural area in a district is estimated by aggregating all weighted individual agricultural plots area for that district.

8. Crop area (cultivated area): Crop area refers to the area occupied by a given crop in a plot considering its density or occupation. In context of Rwanda as well as many African countries, mixed cropping system is a general practice in agriculture.

This practice makes it complex to estimate area under crop cultivation. In case of pure stands (for crop completely covering a plot), crop area is equal or less to physical plot area (if a crop is partially covering the plot, the share is estimated then applied to the plot area). In case of mixed crops, the share of each crop in the plot is estimated by enumerator by eye estimation method and applied to the physical area of the plot to obtain area for each specific crop planted in plot.

In this context, the crop share is eye estimation of crop density or occupation in a plot (in %) basing on spacing between plants. Cultivated area at district level is equal to the total weighted crop areas within plots in the whole district.

Examples

- In case of pure stands, crop area will be equal to the physical area if the crop entirely covers the whole plot. Otherwise, the crop area will be less than physical area. For example, a plot of 1 hectare in which maize was grown and completely occupies the whole plot (100 % occupied), it means that cultivated area for maize is 1 hectare. On the other side let us assume that the maize crop occupies 80 % of the total plot area. In that case the area of maize equals 0.8 hectares (1hectare times 0.8).
- In case of mixed cropping system, specifically seasonal crops the crop area is less than physical area. For example, a plot of 1 hectare grown with maize and beans which occupies 60 % and 40 % of total plot area respectively.
The maize area will be 0.6 hectare (1hectare times 0.6), and beans area will be 0.4(1hectare times 0.4). It is important to note that sum of shares of seasonal crops do not exceed one hundred percent.

9. Developed area: Developed area is the land covered by crops. Due to mixed cropping (over exploitation of agriculture land or under exploitation in case pure cropping), developed area can be less or greater than the physical area.

Basing on the example provided above of the plot in which maize, beans and cassava have been mixed, maize has 0.6, beans have 0.4 while cassava has 0.5 ha. The developed area equals the sum of the crops area equivalent to 1.5 ha.

10. Harvested area: Area harvested is defined as the total number of hectares for all crops that is harvested in a given agriculture season. In case of crops considered as seasonal, the harvested area is assumed to be equal to the cultivated area. For perennial crops a farmer can decide to harvest a portion of land and stores the remaining production in the farm or harvest the whole plot for commercial or other purposes. In this case, the proportion of harvested area is estimated and applied to the plot area to obtain actual harvested area.

For example, cassava which occupies 0.5 hectare has 5,000 trees of cassava. if the farmer only harvested 1,250 trees. In this case, the farmer has harvested only a quarter (0.125hectares) of the cultivated area.

11. Crop yield: Crop yield is defined as total reported quantity of harvested crop over the harvested area of that crop.

12. Crop production: Crop production is the product of crop yield and crop area (harvested). At district level, crop production is estimated by taking crop yield of crop produces times the total harvested area in the district.

III. SURVEY FINDINGS

This section highlights key results of SAS 2022 seasons A, B and C. These results are mainly related to area (physical land use, cultivated area, and harvested area), crop yield and production, agricultural inputs as well as agricultural practices in Rwanda.

3.1. Agricultural land use (,000Ha) for 2022 Season A and B

Figure 2: Agricultural land use in 2022 Season A and B (in thousands of hectares)

Source: NISR, SAS 2022

The total country land area is estimated at 2.377 million of hectares out of which agricultural land (land potential for agriculture) covered 1.402 million hectares (59% of total country land) in Season A. Out of the total agricultural land, 1.067 million hectares was used for Seasonal crops in season A, nearly 0.6 million hectares are area under permanent crops, 0.135 million ha under permanent pasture and nearly 0.1 million ha was fallow coverage. For season B, 1.393 million hectares (58.6% of total country land) is used for agriculture, 1.014 million hectares was used for Seasonal crops, nearly 0.6 million hectares are area under permanent crops, 0.133 million hectares under permanent pasture while 0.125 million ha was fallow.

3.2. Crop area, yield and production for major crops

Figure 3 : Cultivated area by cropping system

Source: NISR, SAS 2022

Figure 3 shows that, the mixed cropping system is still dominant in the agricultural practice with 69.2 percent of the cultivated area in season A compared to 63.7 percent in season B, and 25.4 percent in the small season C.

Maize:

In 2022, maize was cultivated on land estimated at 219,683 hectares in season A compared to 81,339 hectares in season B. Maize production was estimated at 348,907 metric tons in season A and 109,615 metric tons in season B, this is a decrease of 8.0 percent in season A and an increase of 5.4 percent in season B when compared respective seasons of 2021. In seasons A and B, the average yield was 1.6 tons and 1.3 tons, respectively (See Tables 11-26).

Sweet potato:

In 2022, sweet potato was cultivated on land estimated at 97,771 hectares in season A compared to 92,056 hectares in season B and 5,079 hectares in season C. Sweet potato production was estimated to 694,320 metric tons in season A, 649,445 metric tons in season B and 28,980 metric tons in season C. This is an increase of 4 percent in season A, 2.7 percent increase in season in B and 0.7 percent increase in season C when compared to respective seasons of 2021. The average yield was 7.1 tons per hectare in season A, 7.5 tons per hectare in season B and 5.7 tons per hectares in season C (see district details in table 11-26).

Irish potato:

In 2022, Irish potatoes were cultivated on land estimated at 56,442 hectares in season A compared to 52,858 hectares in season B, and 10,458 hectares in season C. Irish potato production was 486,075 metric tons in season A, 331,016 metric tons in season B and 90,916 metric tons in season C. This is an increase of 5 percent in season A and a decrease of 16 percent in season B when compared to the respective seasons of 2021. The average yield of Irish potato was 8.6 tons per hectares in season A, 6.2 tons per hectare in season B and 8.7 tons per hectare in season C (see district details in table 11-26).

Cassava:

In 2022, cassava was cultivated on land estimated at 186,204 hectares in season A compared to 152,470 hectares in season B. Furthermore, harvested area was estimated at 45,418 hectares for season A compared to 48,494 hectares for season B. Cassava production was estimated at 637,856 metric tons in season A and 737,284 metric tons in season B, representing an increase of 6 percent on season A and 2.6 percent increase in season B, when compared to the respective seasons in 2021. The average yield of cassava was 14 tons in season A and 15.2 tons in season B (See district details in Tables 11-26).

Paddy rice:

In 2022, Paddy rice was cultivated on land estimated at 15,840 hectares in season A and 16,517 hectares in season B. Paddy rice production was estimated at 67,002 metric tons in season A and 68,072 metric tons in season B, this is an increase of 4.8 percent in season A and an increase of 0.4 percent in season B when compared to respective seasons in 2021. The average yield was 4.2 tons per hectare in season A and 4.1 tons per hectares in season B (See district details in Tables 11-26).

Bananas:

In 2022, banana was cultivated on area estimated at 259,505 hectares in season A compared to 213,322 hectares in season B. The harvested area was estimated at 108,476 hectares for season A compared to 83,314 hectares for season B. The production of banana was estimated at 1,192,331 metric tons in season A and 1,016,137 metric tons in season B, an increase of 3.5 percent in season A and 2.5 percent in season B when compared to respective seasons of 2021. The average yield of banana was 10.9 tons per hectare in season A and 12.2 tons per hectare in season B (See district details in Tables 11-26).

Beans:

In 2022, beans was cultivated on land estimated at 362,439 hectares in season A compared to 268,634 ha in season B and 3,292 hectares in season C. Bean production was estimated at 235,818 metric tons in season A compared to 210,290 metric tons in season B and 3,381 metric tons in season C, this is a decrease of 9 percent in season A, 8.4 percent in season B and 5 percent in season C when compared to respective seasons of 2021. The average yield of beans was 0.65 tons per hectare in season A and 0.78 tons in season B (See district details in table 11-26).

3.3. Agricultural inputs

The survey results related to use of agricultural inputs (seeds, fertilizers, and pesticides) are presented in terms of percentage of farmers who applied such agricultural inputs during the season.

3.3.1. Use of seeds

Figure 4: Types of seeds used (% of farmers)

Source: NISR, SAS 2022

Figure 4 above shows that, in 2022, 86.8 percent of farmers applied traditional seeds in season A, compared to 92.3 percent in season B and 77.1 percent in season C, while the improved seeds was applied by 13.2 percent of farmers in season A compared to 7.7 percent of farmers in season B, and 23 percent of farmers in season C (See Figure 4).

Figure 5: Use of improved seeds per farmer, plots, and share of land (%)

Source: NISR, SAS 2022

In 2022, 33.1 percent of farmers used improved seeds in season A, compared to 8.7 percent in season B, and 26.1 percent in season C. The improved seeds were applied to 30.9 percent of plots in season A compared to 16.2 percent of plots in season B and 13.2 percent of plots in season C. In regard to cultivated area, the improved seeds were applied to 31.5 percent of cultivated land in season A compared to 17 percent of cultivated land in season B and 18.5 percent of cultivated land in season C (See Figure 5).

Table 5: Source of improved seeds (%)

	2021			2022		
	Season A	Season B	Season C	Season A	Season B	Season C
NGOs/Companies	39.3	30.3	2.7	41.2	23.9	3.5
Agro dealers	37.6	38.9	39.8	36.6	42.8	45.4
Government (MINAGRI/RAB/NAEB)	8.3	9.2	12.6	4.8	9.6	2.7
Market	5.2	7.1	28.6	7.0	8.4	27.5
Recognized seed multipliers	4.3	7.5	9.3	5.3	8.2	11.5
Agriculture cooperative	4.3	5.9	6.7	3.9	6.2	8.3
Other source	1.0	1.0	0.3	1.2	0.9	1.2

Source: NISR, SAS 2022

In 2022 season A, 41.2 percent of improved seeds was obtained from NGO/companies, 36.6 percent from agro-dealers, 7 percent purchased from the market, 5.3 percent from seeds multipliers, 4.8 percent from the government and 3.9 percent from cooperatives. In season B, 42.8 percent of improved seeds was obtained from agro-dealers, while 23.9 percent from NGO/companies. Improved seeds were used mostly for crops such as paddy rice, maize, fruits and vegetables (See details in Tables 5, 33-38).

3.3.2. Use of fertilizers

Figure 6 : Percentage of farmers who applied fertilizers

Source: NISR, SAS 2022

In 2022, 69.7 percent of farmers used organic fertilizer on their farms in season A compared to 57.9 percent in season B and 82.3 percent in season C, while 38.6 percent used inorganic fertilizer in season A compared to 27.5 percent in season B and 71.5 percent in season C. (See Figure 6).

Figure 7: Use of organic fertilizers per farmers, number of plots and cultivated area(%)

Source: NISR, SAS 2022

In 2022 season A, 69.7 percent of small-scale farmers and 73.8 percent of large-scale farmers used organic fertilizer compared to 57.9 percent of small-scale farmers and 58.7 percent of large scale farmers in season B. (See details in Tables 39-41).

Figure 8: Use of inorganic fertilizer per farmers, number of plots and cultivated area (%)

Source: NISR, SAS 2022

In 2022, 38.6 percent of farmers used inorganic fertilizer in season A compared to 27.5 percent in season B and 71.5 percent in season C. In season A, 37.6 percent of small-scale farmers and 83.5 percent of large-scale farmers used inorganic fertilizer, while 26.6 percent of small-scale farmers and 72.4 percent of large-scale farmers used it in season B (See Figure 8).

Table 6 : Percentage of farmers by source of inorganic fertilizers

	2021			2022		
	Season A	Season B	Season C	Season A	Season B	Season C
Government (MINAGRI/RAB/NAEB)	3.6	3.5	1.7	2.2	2.5	0.4
Agro dealers	46	50.3	64.4	43.6	52.9	63
NGOs/Companies	42.2	36.9	15.1	46.7	34.1	18.7
Market	3.8	5.9	10.6	5.4	7.3	10
Agriculture cooperative	3.7	3.1	7.8	1.8	2.8	7.3
Other sources	0.7	0.4	0.3	0.3	0.6	0.5

Source: NISR, SAS 2022

In regard to source of fertilizers, in season A, 46.7 percent of famers bought inorganic fertilizers from NGOs/companies; 43.6 percent of farmers gained inorganic fertilizers from agro-dealers while in season B, 52.9 percent and 34.1 percent of farmers sourced the inorganic fertilizer from agro-dealers and NGOs/companies respectively. (See details in Tables 6, 42-51).

Figure 9 : Type of inorganic fertilizer used (%)

Source: NISR, SAS 2022

In 2022 season A, DAP was used by 46.9 percent of farmers, UREA was used by 37.8 percent of farmers while NPK was used by 14.5 percent of farmers, while in 2022 season B, DAP was used by 40.8 percent of farmers, UREA was used by 34.9 percent of farmers while NPK was used by 21.5 percent of farmers (See details in Tables 42-51).

3.3.3. Use of pesticides

Figure 10: Use of pesticides per farmer, number of plots and cultivated area (%)

Source: NISR, SAS 2022

In 2022 season A, 19.8 percent of farmers used pesticides compared to 15.9 percent in season B and 70.1 percent in season C. In season A, 18.6 percent of small-scale farmers and 72.3 percent of large-scale farmers used pesticides, while 14.7 percent of small-scale farmers and 74.9 percent of large-scale farmers used pesticides (See details in Tables 52-55).

In regard to type of pesticides, 37.5 percent of farmers applied Rocket, 26.8 percent of farmers applied Dithane and 14.7 percent applied Cypermethrin in season A while in season B, 43.1 percent applied Dithane, 29.9 percent of farmers applied Rocket and 14.3 percent applied Cypermethrin (See details in Tables 52-55).

3.4. Agricultural practices

Agricultural practices were collected during the SAS 2022, and the data is presented in terms of the percentage of farmers who participated in such practices.

3.4.1. Irrigation practices

Figure 11: Farmers who practiced irrigation (%)

Source: NISR, SAS 2022

In season A of 2022, 8.2 percent of farmers practiced irrigation compared to 8.0 percent of farmers in season B and 62.9 in season C. In regard to farmer categories 7 percent of small-scale farmers and 59.8 percent of large-scale farmers practiced irrigation in season A compared to 6.9 percent of small-scale farmers and 61.8 percent of large-scale farmers in season B.

Out of farmers who practiced irrigation in 2022, 39.4 percent used traditional irrigation techniques in season A compared to 38 percent in season B and 83.6 percent in season C while modern irrigation was practiced by 60.6 percent in season A, 62 percent in season B and 16.4 percent in season C. In regard to source of water used for irrigation Lakes/stream is predominant across seasons with 47.4 percent in season A, 53.1 percent in season B and 53.1 percent in season C followed by underground water by 25.5 percent in season A, 27 percent in season B and 44.6 percent in season C (See details in Tables 56-60)

3.4.2. Mechanisation

Figure 12: Farmers who used any mechanical equipment for agriculture activities (%)

Source: NISR, SAS 2022

In 2022, 0.7 percent of farmers used mechanical equipment for agriculture in season A compared to 0.6 percent of farmers in season B and 0.3 in season C. Regarding to farmer categories 19.2 percent of large-scale farmers used mechanical equipment for agriculture in season A compared to 15.6 percent of large-scale farmers in season B (See details in Tables 56-58)

3.4.3. Erosion control measures

Figure 13: Farmers who protected land against erosion (%)

Source: NISR, SAS 2022

In 2022, 92.1 percent of farmers practiced anti-erosion activities in season A compared to 91.4 percent in season B and 95.9 percent in season C. In regarding to farmer categories, 92 percent of small-scale farmers and 95.1 percent of large-scale farmers protected their land against erosion in season A compared to 91.3 percent of small-scale farmers and 95.1 percent of large-scale farmers in season B.

In regard to types of anti-erosion used, cover plants were the most used type of anti-erosion with 57.1 percent of farmers in season A against 58.2 percent in season B and 38.9 percent in season C. Regarding to erosion degree, splash erosion or low erosion appeared the most across season with 46.1 percent in season A, 51.9 percent in season B and 45.9 percent in season C while severe erosion cases were few across seasons with 2.6 percent in season A, 1.2 percent in season B and 3.1 percent in season C (See details in Tables 56-64).

3.5. Sowing dates

Results show that in 2022 season A, 36.7 percent of crops were planted in September 2021, 23.5 percent of crops were planted in October 2021, with the remainder, mainly perennial crops planted before September and few seasonal crops planted after October 2021. In Season B, 30.3 percent of crops were planted in February 2022, 15.8 percent in March 2022, with the remainder, mainly perennial crops were planted before February and few seasonal crops were planted after February 2022. (See details in table 30 and 31).

3.6. Gross Value Added (GVA) of individual crops

The Gross Value-Added value of different crops is shown in constant 2017 prices. The results showed that the gross value added of crops such as maize, sorghum, wheat, sweet potatoes, cooking banana, banana for beer, and soya increased in 2022 compared to 2021. While the Gross Value Added (GVA) for crops such as paddy rice, cassava, Irish potatoes, dessert banana, beans, peas, and groundnut were lower than the previous year.

Table 7: Main crops Gross Value Added in constant 2017 prices (Billion Frw /ha)

Crops	2016	2017	2018	2019	2020	2021	2022
Maize	402,114	309,457	365,527	373,066	389,059	387,754	390,303
Sorghum	274,987	296,000	298,689	274,485	280,068	299,996	302,122
Paddy rice	1,304,073	1,633,520	1,492,544	1,718,397	1,691,890	1,799,480	1,799,248
Wheat	237,012	282,068	306,210	329,278	289,132	303,795	321,878
Cassava	177,496	305,145	1,377,459	1,629,739	1,642,935	1,653,322	1,648,255
Sweet potato	808,499	784,244	899,497	890,254	932,227	903,969	950,888
Irish potato	1,230,891	1,713,831	1,444,199	1,700,490	1,544,227	1,551,234	1,425,235
Cooking banana	185,884	199,565	3,715,919	3,623,122	3,180,479	3,089,892	3,119,720
Dessert banana	122,667	117,981	2,163,072	1,481,763	1,162,979	1,162,822	1,132,818
Banana for beer	108,416	102,332	1,122,757	879,672	931,198	958,935	974,510
Beans	401,317	391,605	410,264	391,121	318,642	334,063	333,464
Pea	1,086,082	1,060,761	964,611	1,049,992	1,365,309	1,355,647	1,284,987

ANNEX

STAFF WHO CONTRIBUTED TO THE SEASONAL AGRICULTURAL SURVEY 2022

National Coordinators

- Yusuf MURANGWA, Director General, NISR
- Ivan MURENZI, Deputy Director General, NISR

Technical coordination

- MWIZERWA Jean Claude, Director of Economic Statistics Department
- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- BIZIMUNGU Clément, Field operations Cartographer Officer

Sample frame design

- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- BURAMBA Eric, Seasonal Crop Production Statistician

Field work coordination

- KAMANZI SHINGIRO Jean Philbert, Research assistant
- MUKAMAZIMPAKA Francine, Perennial crops and horticulture statistician

Data analysis

- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- MUVUNYI Issa, Livestock and fisheries production statistician
- MUTEBUTSI Alexis, Research assistant
- MUREBWAYIRE Divine, Research assistant
- RWAYITARE Jean Bosco, Research assistant

GIS

- BIZIMUNGU Clément, Field operations Cartographer Officer
- KARERA Albert, Geometrician in charge of map design & production
- NTAWIHA Athanasie, SPIU GIS staff
- IRAMBONA Eddy Marcus, SPIU GIS staff
- NIYITEGEKA Beata, GIS Support Staff
- NDAZIGARUYE Alfred, GIS Support Staff
- NGABO MUHIRE Olympe, GIS Support Staff

Data processing

- SEBAHIRE Jean Népomuscène, Food Security & Agriculture Surveys Data Processing Officer
- RWAYITARE Jean Bosco, Research assistant

Report writing and editing

- RWAYITARE Jean Bosco, Research assistant
- MUTEBUTSI Alexis, Research assistant

SAMPLING ERRORS

The sample survey results can be affected by two types of errors (i) sampling errors and (ii) non sampling errors. Non sampling errors refers to all sources of errors that are unrelated to sampling. They occur in all aspect of the surveys process during data collection and processing. They can be classified into four categories: coverage errors, measurement errors, non-response error, and processing errors. Efforts are made during the implementation of survey to minimize these errors but, it is not possible to eliminate all of them. Non-sampling errors are often extremely difficult, if not impossible to measure.

Sampling errors are those errors associated with sampling selection process. These errors are caused by observing a sample instead of the whole population and refer to the difference between the estimate derived from a sample survey and the true value that would result if a census of the whole population were taken under the same conditions.

The sample of segments and plots selected for the SAS 2021/22 is one of many possible samples. The estimates obtained from the selected sample would differ from estimates which could be obtained from other samples of the same size and sampling method taken from same population. Sampling error causes variability among estimates derived from different samples when keeping the same sample size and design, and the same estimation method used. It's measured commonly by the standard error which is the square root of the sampling variance. The variance depends on many things, including the sampling method, the estimation method, the sample size, and the variability of the estimated characteristic.

In order to examine the precision of the most important estimates from the SAS 2021/22 data and the statistical efficiency of the sampling frame and sample design, it is important to calculate the sampling errors and corresponding coefficients of variation (CVs) for these estimates, such as the total area in each major crop. The sampling error of each estimate is measured by the standard error, or square root of the variance. The Complex Samples module of SPSS and Stata uses a linearized Taylor series variance estimator that takes into account the stratification and clustering in the sample design.

The variance estimator for a total used by the Complex Samples module of SPSS and Stata can be expressed as follows:

Variance Estimator for a Total

$$V(\hat{Y}) = \sum_{h=1}^L \left[(1 - f_h) \times \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right)^2 \right],$$

where:

f_h = first stage probability for stratum h; $(1 - f_h)$ is the finite population correction (fpc) factor

$$\hat{Y}_{hi} = \sum_{j=1}^{m_h} W_{hi} y_{hij}$$

y_{hij} = value of variable y for the j-th sample plot in the i-th sample segment of stratum h

$$\hat{Y}_h = \sum_{i=1}^{n_h} \hat{Y}_{hi}$$

Variance Estimator for a Ratio

$$V(\hat{R}) = \frac{1}{\hat{X}^2} \left[V(\hat{Y}) + \hat{R}^2 V(\hat{X}) - 2 \hat{R} COV(\hat{X}, \hat{Y}) \right],$$

where:

$$COV(\hat{X}, \hat{Y}) = \sum_{h=1}^L \left[(1 - f_h) \times \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{X}_{hi} - \frac{\hat{X}_h}{n_h} \right) \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right) \right]$$

$V(\hat{Y})$ and $V(\hat{X})$ are calculated according to the formula for the variance of a total.

In addition to the standard error, the program computes the design effect (DEFF) for main indicator (area under cultivation). The design effect is defined as the variance of an estimate based on the actual complex sample design divided by the corresponding variance from a simple random sample of the same size. It is a measure of the relative statistical efficiency of the sample design, taking into account both the stratification and clustering in the sample design. The clustering generally increases the design effect due to the intracluster correlation of plots within the segments. At the same time, the land-use stratification of the segments will decrease the design effects because it is more efficient than a simple random sample.

The estimates of the total area of major crops at the national level and the corresponding measures of precision (standard error (SE), the coefficient of variation (CV), the 95 percent confidence interval, the design effect (DEFF), and number of unweighted observation (n of sample plots)) from the SAS 2021/22 data are presented in Table 1.

The confidence interval (e.g., as estimated cultivated area for maize) can be interpreted as follows: the estimated area under cultivation of maize is 219,683 hectares, and its standard error is 5,334.4. Therefore, to obtain the 95 percent confidence limits, adds, and subtracts the standard error to the sample estimate times confidence interval value. There is a high probability (95 percent) that the true, area under maize cultivation is between 209,216ha and 230,150ha.

A DEFF value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates an increase in the sampling error due to the use of a more complex and less statistically efficient design, such as multistage and cluster selection. It can be seen in the results that the design effects for the estimates of total area for some crops are lower than 1, indicating that the increase in sampling efficiency from the land-use stratification more than off-sets the effects of clustering for these crops.

Table 1: Estimates of total area by major crop at the national level from the SAS 2021/22 Season A data, with standard error, CV, 95% confidence interval, design effect and number of sample observations

3.1 Crop name	Estimate	SE	CV	95% Confidence Interval		DEFF	No. observations (plots)
